# How Agilix Pest Terminator works

Agilix Pest Terminator utilizes entomopathogenic fungi to infect insects.

During infection process, the fungi will latch itself onto the host before penetrating through its surface and into the body. The fungi will then infect, germinate and multiply inside the insect, effectively killing it. The infection will then spread to the rest of the colony.

This process takes 1 to 7 days depending on the type of pest infected and the environment.

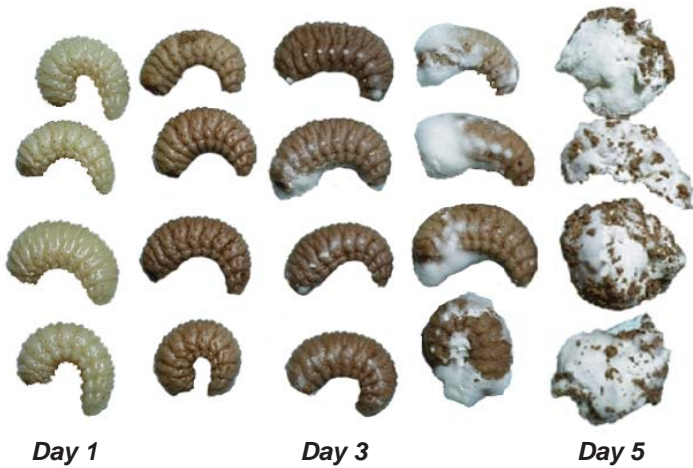

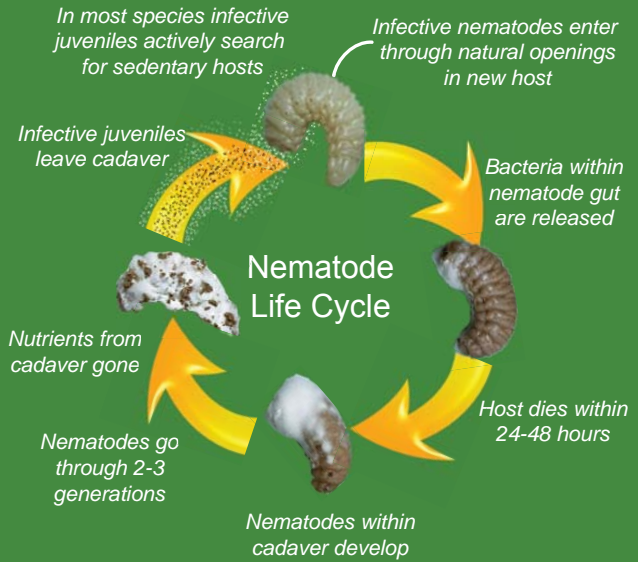

Image shown demonstrates the effect of Agilix Pest Terminator on a maggot over a span of 5 days.

## Standard Packaging:

Agilix Pest Terminator is available in 1-litre spray bottle, 5-litre bottle and 20-litre container.

## Recommended Applications:

### Industrial:

Dilute a ratio of 2 - 5 litres of Agilix Pest Terminator Concentrate to 1,000 litres of water, based on the condition of the pest infection.

To be used with a spray container, sprinkler system or fogging equipment.

### Household:

Using our ready-to-use 1 litre household spray, spray lightly towards the infested area.
